Follow one rate: from the page to the ledger

One real number from a signed State of Texas contract with Accenture, followed through the six stages of the pipeline. The same row appears under every stage, exactly as the code recorded it. Beneath it, the row that gets flagged instead, because refusing to guess is the point.

> **Everything here is real.** The document is public and unchanged. Every value is read from the ledger written by the run of October 6, 2026 or from the page itself. Nothing is mocked, rounded or filled in. Where the system did not know, the field is empty and says so.

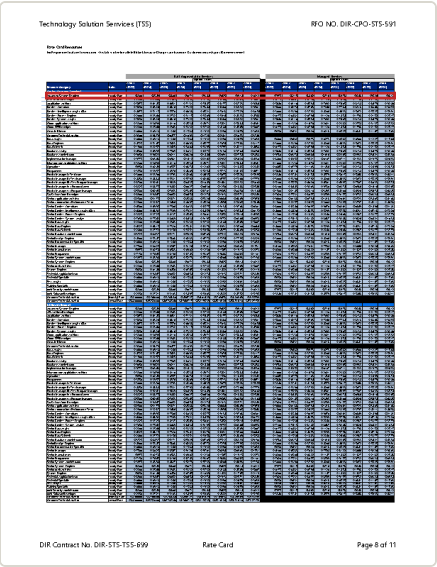

The six stages, one row

1

The document library

The collection of real contracts, rate cards, invoices and timesheets gathered to build the product. This one is Attachment 2.1, Pricing and Volumes, of Texas contract DIR-STS-TSS-699 with Accenture LLP, fetched from the Texas Department of Information Resources website.

THIS ROW

FILE
`085_Texas_DIR_Accenture_LLP_rate_exhibit.pdf`

PAGE
8 of 11 (the footer reads “Rate Card”)

SOURCE CLASS
public

The red box is the row this page follows. It is drawn from the position the ledger stores, not by hand. Click the page to see it at full size.

2

Intake

The front door. Each file gets a permanent id and a fingerprint of its contents, is checked for what it really is (by looking inside, never by its name), labelled, and linked to the other files of the same contract. One contract is usually several files; this one is seven.

THIS ROW

DOCUMENT ID
`doc_2342f37dadc19638`

FINGERPRINT
`2342f37dadc19638…`

TRUE TYPE
pdf (content checked)

LABEL
rate card, confidence 0.85

EVIDENCE
`'pricing and volumes' in first pages`

CONTRACT NUMBERS
`DIR-CPO-STS-591, DIR-STS-TSS-699`

CONTRACT SET
exhibit of the master agreement (file 081)

LINK EVIDENCE
contract number DIR-STS-TSS-699 printed in the first pages of both; confirmed

READINESS
text: usable text layer, 11 pages

> Linking only on strong evidence: the contract number printed on the page. Without it, intake suggests a link and asks.

3

Reading

Turns the file into text and tables that software can use, with the page and position of every element. A position is a box: four numbers, left, top, right, bottom, in points from the page corner. The box is what lets any number later light up its spot on the page.

THIS ROW

READER
local text-layer reader (no OCR needed)

QUALITY
native: text layer present, 26,304 characters over 11 pages

PAGE 8
116 text lines, 1 table of 111 rows by 19 columns (2,109 cells), each with a box

TITLE CELL
`row 4, col 0 “Advanced Systems Engineer” [64.3, 127.6, 151.1, 133.2]`

RATE CELL
`row 4, col 2 “$83.00” [176.5, 127.6, 200.1, 133.2]`

TEXT LINE
`[65, 128, 553.8, 132.6]`

Scan quality follows the row all the way to the ledger. A rate from a poor scan is never trusted as much as one from a native file.

4

Extraction

5

Normalization

6

The ledger

A frontier model (rented, reached through one wrapper so it can be swapped) reads the table and fills a typed record: title, rate, unit, currency, period, location, each with a confidence. It records the words as written and does not interpret them. Then the software checks that every number it returned literally appears on the page at the claimed spot.

THIS ROW

none on the page

CONFIDENCE

0.95

> Verified: the line “Advanced Systems Engineer | Hourly Rate | $83.00” is on page 8 inside box [65, 128, 553.8, 132.6]. 53 rows kept from this file, 0 rejected. A test proves an invented number ($999.99) is thrown out.

> Where the model is unsure of a field it leaves it blank and says why. It never fills a default.

Turns the vendor’s words into the standard categories the ledger needs: a canonical role (one of 130) and a seniority band (one of four: junior, intermediate, senior, lead/principal). The rate itself is never changed. A title is resolved once, with its reasoning, and written to a mapping table; every later occurrence is a lookup, so the same title can never resolve two ways.

THIS ROW

LOOKED UP

“Advanced Systems Engineer” was already in the mapping table

RESOLVED BY

a person, Kyle McNamara, during the Role Framework stage, from this same exhibit (mapping confidence 1.00)

LOCATION

kept as written, not classified

STATUS

resolved

> The platform never decides from a place name whether work is onshore, nearshore or offshore; an analyst categorizes a place once for a client, then it is a lookup. “Onsite (Customer Location)” stays as the page says it.

The book of record: one row per rate seen, kept forever inside the client’s own environment, with everything needed to trace it back to the page. Re-runs add rows and mark old ones superseded; nothing is overwritten. Rows below the confidence threshold stay visible but are not counted until an analyst confirms them.

THIS ROW, AS STORED

ROW

`obs_id 1, run run_2026-10-06_d19b5b`

VENDOR / CLIENT

Accenture LLP / Texas DIR

RATE

`83 USD per hour; as stated “$83.00”`

PERIOD

Year 1 (FY27); effective date: not stated on the page, left empty

QUOTE

`Advanced Systems Engineer | Hourly Rate | $83.00`

WRITTEN

`2026-10-06 19:07 UTC`

> Nothing in this row is an estimate. A vendor who challenges it is shown page 8 with the box lit.

The review queue: where the system stopped and asked

Every place the pipeline was not sure, it left the field empty, wrote one sentence a consultant can read, and put the item in a queue. An analyst decides once; the decision becomes a rule, so the same question is never asked twice for the same client. From this contract set the run left **7 open items**:

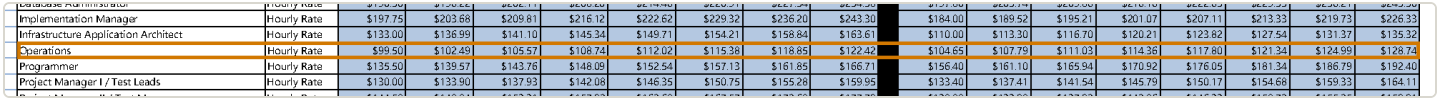

KIND	ITEM	RATE	WHY IT IS HERE
title	Operations	$99.50	no rule match; the model was asked and abstained; an analyst decides
title	Technical Specialist	$106.00	no rule match; the model was asked and abstained; an analyst decides

title	Project Manager I / Test Leads	$130.00	one label for two jobs (project management and testing); ambiguous by design, the statement of work decides
title	Project Manager II / Test Manager	$144.50	one label for two jobs (project management and testing); ambiguous by design, the statement of work decides
title	Project Manager III / Test Program Manager	$187.00	one label for two jobs (project management and testing); ambiguous by design, the statement of work decides
extraction	084_Texas_DIR_Accenture_LLP_rate_exhibit.pdf		no rate-bearing table found in the reading; nothing to extract (Exhibit 2 is prose about financial provisions, not a rate table)
intake	087_Texas_DIR_Accenture_LLP_signed_contract.pdf		classification 'msa' is weak (0.50): confirm; a 3-page attachment whose first pages gave no signal, so the label rests on the file name only

Across both contract sets run so far, 21 items are open. None of them is a place name: neither document names a city.

A row that gets flagged instead

Same page, same table, fourteen rows down: a title the system could not place. It went through the same six stages and stopped at the fifth. Abstaining is not a failure of the pipeline. A false claim in front of a vendor could lose the engagement; a missed row is caught at the next pass.

Implementation Manager	Hourly Rate	$197.75	$203.68	$209.81	$216.12	$222.62	$229.32	$236.20	$243.30	$184.00	$189.52	$195.21	$201.07	$207.11	$213.33	$219.73	$226.33

STAGES 1 TO 4: IDENTICAL

Title as written Operations

Rate as written $99.50 per hour (USD)

Period Year 1 (FY27)

Location as written Onsite (Customer Location)

Verified on the page “Operations | Hourly Rate | $99.50”, page 8, box [65, 228.5, 553.8, 233]; extraction confidence 0.95

STAGE 5: NORMALIZATION STOPS

Rules no match in the mapping table and no rule applies: “Operations” alone names no role

The model is asked it answered with confidence 0.30, below the floor of 0.75, and so abstained. In its own words:

> *The bare title 'Operations' carries no qualifier, so it cannot be told apart between it_operations_manager (operations management) and it_operations_analyst (operations support specialist and command-…*

The ledger keeps the first 300 characters of the reason; the sentence continues in the model’s answer.

STAGE 6: STORED, NOT COUNTED

Row obs_id 19

Role empty

Band empty

Status flagged

Counted no: excluded from every benchmark and every savings total until an analyst decides

Queue item kind title, status open

What happens next the analyst reads the statement of work, picks the role (or none), writes one line of reasoning. From then on “Operations” from this vendor at this client is a lookup.

Coming: savings stacking

This box is a placeholder on purpose. No finding exists yet, and nothing below is computed. Once findings exist, this is where the row’s savings will appear, stacked into three tranches so that no dollar is counted twice:

CONTRACTUAL

The rate billed against the **contracted rate**, the price the statement of work or master agreement says the vendor may charge for this role. No contracted rate for the role means $0 here, with the reason stated, and a separate finding that a role was billed without one.

OPERATIONAL

The contracted rate against the vendor's own best rate for the same role and band at this client. No second rate from the same vendor means $0 and says so.

MARKET ALIGNMENT

Against the market mid-point for the same role, band and location: the consortium-plus-public distribution, published only when a cut has at least 3 observations and 2 contributing clients. A rate already below the mid-point is reported as below market, a fact, never a negative saving.

Observed and projected savings will be two labelled numbers, never one blended total. A missing reference always yields zero plus an explanation, never a guess.

The whole file, and the run behind this page

This contract set 7 files, one contract set under DIR-STS-TSS-699

This file 53 rate rows kept, 48 resolved to a role (23 of them with no seniority stated, so left unbanded on purpose), 2 to the queue, 3 ambiguous by design, 48 counted toward benchmarks

Year 1 only the table prices eight contract years; the run kept the first. Escalation columns are a follow-up.

Second contract set, same code Accenture's UK G-Cloud 15 rate page (a web page, not a PDF): 430 rows kept, 416 resolved (90 unbanded on purpose), 14 to the queue, 410 counted

Ledger today 483 rows, 458 counted, 464 resolved, 16 flagged, 3 ambiguous, 21 queue items open, 6 titles newly resolved by the model and awaiting an analyst's confirmation

Run run_2026-10-06_d19b5b, October 6, 2026, model claude-opus-5-5, rule version 0.1, reader local

084_Texas_DIR_Accenture_LLP_rate_exhibit.pdf	rate card (0.85)	25	exhibit of the master agreement	
085_Texas_DIR_Accenture_LLP_rate_exhibit.pdf	rate card (0.85)	11	exhibit of the master agreement	
086_Texas_DIR_Accenture_LLP_signed_contract.pdf	service-level definitions (0.80)	33	exhibit of the master agreement	
087_Texas_DIR_Accenture_LLP_signed_contract.pdf	master agreement (0.50)	3	exhibit of the master agreement	classification 'msa' is weak (0.50): confirm

Two labels differ from what a person would write. File 084 is Exhibit 2, Financial Provisions; intake called it a rate card from the words “rate card services” in its table of contents, and extraction then found no rate table in it and said so. File 087 is a 3-page key-personnel attachment; intake could only fall back on the file name and flagged its own label as weak. Both are in the queue above.

ROW	TITLE AS WRITTEN	RATE	ROLE	BAND	STATUS	COUNTED
1	Advanced Systems Engineer	$83.00	systems_engineer	senior	resolved	yes

Rows 52 and 53 are the same title priced per month and per year on the page; they are stored as stated, per month and per year, never converted to an hourly figure.

Terms used on this page

Document library	The collection of real documents gathered to build the product. Example: the 13 UK G-Cloud rate cards and this Texas contract.
Contract set	The files that belong to one contract. Example: this master agreement, its statement of work, exhibits and attachments, seven files.
Contracted rate	The price the statement of work or master agreement says the vendor may charge for a role. Example: $83.00 per hour for an Advanced Systems Engineer, onsite, in year 1.

Ledger	The book of record of every rate seen, with its source. Example: row 1 above.
Mapping table	The list of vendor titles already resolved to a role and band, with the reasoning and who decided. Example: “Advanced Systems Engineer” to Systems Engineer, senior.
Role and band	The two axes of the role framework: what the person does (130 roles) and how senior they are (four bands). Location and technology are recorded beside them, never multiplied into the rate.
Box	Four numbers giving a position on a page: left, top, right, bottom, in points from the top-left corner. Example: [65, 128, 553.8, 132.6].
Confidence	A number from 0 to 1 that a stage attaches to its own answer. Below the floor, the answer is withheld and the item is flagged. Example: the model’s 0.30 for “Operations”.
Counted	Whether a row may enter benchmark distributions and savings totals. Only rows above the confidence threshold, from a usable scan, with a resolved title, count.
Model	A frontier language model, rented through one wrapper. TWM owns everything around it: the record shapes, prompts, checks, the role framework, the mapping table and the evaluation sets.

Source document: Texas DIR contract DIR-STS-TSS-699, Attachment 2.1 Pricing and Volumes, Accenture LLP, published by the Texas Department of Information Resources (dir.texas.gov), 11 pages. Ledger: the single-file prototype ledger, run run_2026-10-06_d19b5b. Page built October 13, 2026 from the ledger and the PDF by a script; no value on it was typed by hand.

This page shows public documents only. In a client deployment the ledger, the documents and every row stay inside the client’s own environment; only vocabulary and cohort summaries ever leave.
